

AutoTap Faucet User Manual

How to use Your AutoTap

AutoTap has two modes of operation. Momentarily On / Off and a constant flow with a 60 second safety auto shut off. In either mode the faucet lever, hot and cold or in mix should always be left in open position.

The Instantaneous On / Off use is the most convenient and practical way to use your AutoTap. By pressing and releasing the pedal, AutoTap conveniently and hygienically turns on and off the faucet as you need when you need, saving you water and energy by preventing unnecessary runoff.

For Constant Flow, a one quick tap on the pedal/ cabinet door will turn on the faucet up to 60 seconds. A second quick tap stops water flow.

How to save water with AutoTap

Each day in the process of washing hands, brushing teeth or washing dishes by hand, millions of gallons of heated water are being wasted as runoffs. AutoTap's instantaneous ON / OFF capabilities help the user to control the unnecessary water runoff.

How to return your faucet back to manual use

If for any reason you need to turn your faucet back to manual operation, quickly tap the pedal or cabinet door once, then while the water is running, disconnect the battery from the module. The water stays on until the battery once again is connected to the module for pedal use.

How to change the battery

The AutoTap faucet controller is a very efficient system. In normal office and home use, the battery life lasts about 3 years. In changing the battery's correct polarity, placement in battery holder is most important. Refer to installation manual for correct battery installation.

Battery type: 4x AA Duracell or equivalent alkaline batteries are recommended. Do not use an inferior quality battery with this system.

Upgrading your AutoTap

AutoTap is the only faucet controller on the market with an interchangeable design that can be easily adapted to your special needs without any change to the existing hard plumbing. For example, adding a knee operated cabinet door switch to your existing pedal switch or vices versa. In this configuration, the user can turn on and off the faucet by touching the knee to the cabinet door or use the pedal. Also, you can easily upgrade your AutoTap to control hot and cold water individually.

System maintenance

AutoTap faucet controller is a time tested system requiring no service. That said, like any other plumbing fixtures sediment built-up may interfere with its function. Should this happens during the warranty period, the AutoTap manifold exchange program can send a replacement manifold for a nominal charge.

Warranty

AutoTap is manufactured under the highest standards and workmanship and is warranted to be free from defects for 5 years from the date of purchase.

AutoTap, at its option, repairs, replaces or provides replacement parts for any defective unit provided that the unit was not misused, abused or altered. This warranty does not include manifold malfunction caused by water born debris or sediment buildup after the 3rd year of use.

How to get warranty service:
